The diversity of NUK Soothers

Understanding Life.

NUK Soother – for healthy development.

Together with experts such as paediatricians, midwives, orthodontists and nutrition experts, NUK develops products which help children in each phase of their life and make the everyday life of parents easier. The first NUK Teat was also the first teat suited to the jaw – it was devised by two dental specialists, who discovered better jaw and teeth development in children who were breastfed rather than bottle-fed.

Why do NUK Soothers have this special shape?

All NUK Soothers have an asymmetrical shape that resembles a mother's nipple while breastfeeding. There is plenty of room underneath for the tongue for natural sucking movements, while the domed shape of the top fits the mouth perfectly. The neck of the teat is narrow, letting the lips close around it. The NUK Air System ensures that air can escape from the baglet at any time and so it always remains nicely flat. The heart-shaped mouth shield fits a child's face in the best way possible, leaving plenty of space under the nose.

Does my child need a soother at all?

Every baby enters the world with an innate need to suck. It not only makes sure they can get their precious breast milk, it also calms them too. For many children breastfeeding alone is not enough to soothe them, so a soother can help. While your child is sucking, it is giving the muscles a workout and perfecting the interplay between the jaw, palate, tongue and lips.

Which is better: soother or thumb?

Soothers are softer and more flexible than a thumb. A soother with an intelligent teat shape, unlike a thumb, promotes the healthy

development of the mouth and reduces the risk of teeth misalignment. In general, it is easier to stop using a soother too because you do not always have it to hand.

Why are there different sizes of soothers?

A mother's breast may not change, but a baby's mouth, like everything else, grows quickly in the first months of life. However, to guarantee a shape that fits perfectly at any stage, there is the NUK Sizing System. It corresponds ideally to the anatomy of a child.

THE NUK SIZE CONCEPT

To optimally suit the natural jaw development of the child.

This is a recommendation only – please take into consideration the individual development of your child. Only Genius soothers are available for 0-2 months.

Why are there honey-coloured and transparent soothers?

NUK Soothers come in two different materials: the honey-coloured natural substance latex and the transparent synthetic material silicone. Simply choose whichever one you prefer – often children make the choice themselves. Here is some information to help with the decision making:

Latex: completely natural product; very soft; very flexible but bite resistant; own natural taste

Silicone: high-quality, transparent synthetic material; neutral in smell and taste; particularly heat and light-resistant

The Original: *NUK Classic*.

Quality right from the start: NUK Classic Soothers are still as good a choice today as they were in the past. Both natural and shaped to fit the jaw and with modern colours and motifs, the NUK Classic has accompanied children through the first years of life for generations.

The Breathable: *NUK Freestyle.*

The youngest member of the NUK Soother family is especially skin-friendly* thanks to its intelligent ventilation holes and less surface area. The domed, anatomically-shaped mouth shield of the NUK Freestyle is an optimal fit for a child's face, while the stylish motifs charm an extra smile onto everyone's face.

for 0-2
months

Naturally ingenious: *NUK Genius*.

The best soother of its kind: the optimised shape of the NUK Genius that is right for the jaw makes it 45% softer, 35% thinner, 9% narrower and even smoother than before. It is now particularly soft on the top, has an extra-flat baglet and an even thinner teat neck. So, it exerts as little pressure as possible on the jaw and, later, the teeth – calming your baby down in a way that is kind to their teeth too.

How hygienic do soothers have to be?

In the first months of life, soothers should be cleaned every time before use – the NUK Baby Bottle Cleanser is particularly suitable as it has a gentle, nature-based formulation. Sterilise soothers before they are used for the first time and then regularly afterwards – either in boiling water or with the NUK Vapo Rapid Steam Steriliser, for example. A soother chain is a good way to stop the soother falling onto the ground.

When should I replace a soother?

It is time for a new soother every 1 to 2 months. If it is damaged in the slightest way it should be replaced immediately.

How can I get my child to stop using a soother?

Even when the need to suck eases off with time, it could be that you have to use a trick. At three years of age at the latest, children should do without their soother. The story of the Soother Fairy has proven useful: she grants children one wish if they give up their soother.
